# Blockchain-Based Zakat Management in Malaysia & Indonesia:

Lessons for Cross-Context Transferability  
Presented by Moniruzzaman, PhD Candidate

## Abstract

This proposal examines the feasibility of a Shari'ah-compliant blockchain-based framework for zakat management in Malaysia and Indonesia. Zakat institutions in both countries have shown growing interest in digital technologies to improve transparency, accountability and administrative efficiency. However, existing research on blockchain and zakat remains limited, fragmented and largely descriptive. Using Malaysia and Indonesia as comparative cases, this study proposes primary quantitative and qualitative research to assess how blockchain can be adopted in zakat management while remaining consistent with Shari'ah governance principles. The analysis will examine stakeholder perceptions, adoption barriers, governance requirements and institutional readiness across the two cases. The study aims to develop a practical framework for blockchain-based zakat management that responds to institutional and regulatory variation across both cases.
